- 上次留下的几个问题
- Press 和 Dyson 的文章
  - 预备知识
  - Zero-Determinant Strategies
  - 如何作用
  - 总结和讨论

- A cooperator pays a cost,  $c$ , for each neighbor to receive a benefit,  $b$ .
- Defectors have no costs, and their neighbors receive no benefits.
- The benefit-to-cost ratio must exceed the average number of neighbors,  $k$ , per individual:

$$\begin{array}{cc} C & D \\ \hline C & \begin{pmatrix} b-c & -c \\ b & 0 \end{pmatrix} \\ D & \end{array}$$

$$b/c > k \quad \Rightarrow \quad b > kc$$

# Iterated Prisoner's Dilemma (IPD)

- $(T, R, P, S)$
- $T > R > P > S$
- $2R > T + S$

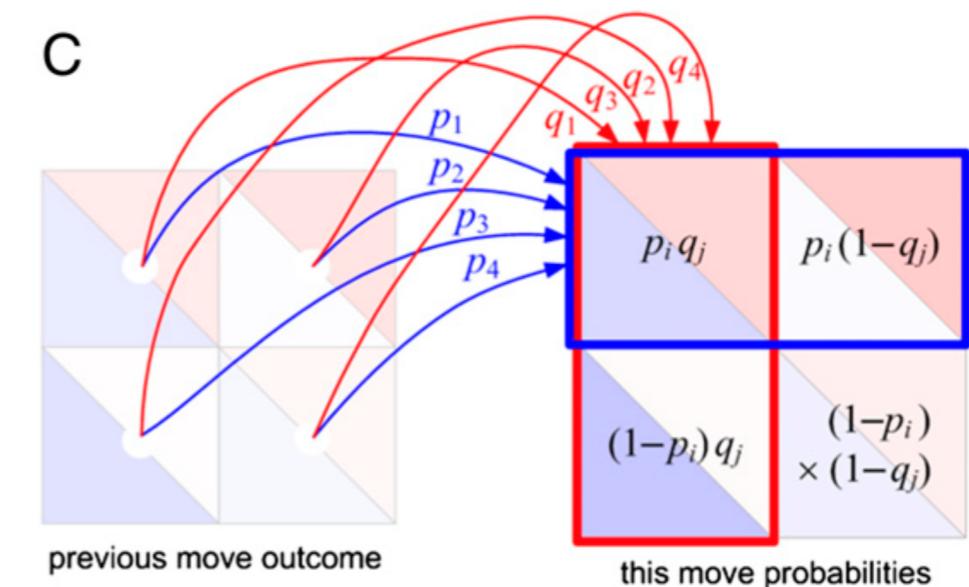

# Memory One

- The same game (same allowed moves and same payoff matrices) is indefinitely repeated: Shortest-Memory Player Sets the Rules of the Game

# Strategy vector

- $p = (p_1, p_2, p_3, p_4)$  for  $xy \in \{cc, cd, dc, dd\}$
- $q = (q_1, q_2, q_3, q_4)$  for  $yx \in \{cc, cd, dc, dd\}$

# Markov transition matrix

$$\begin{bmatrix} p_1 q_1 & p_1(1 - q_1) & (1 - p_1)q_1 & (1 - p_1)(1 - q_1) \\ p_2 q_3 & p_2(1 - q_3) & (1 - p_2)q_3 & (1 - p_2)(1 - q_3) \\ p_3 q_2 & p_3(1 - q_2) & (1 - p_3)q_2 & (1 - p_3)(1 - q_2) \\ p_4 q_4 & p_4(1 - q_4) & (1 - p_4)q_4 & (1 - p_4)(1 - q_4) \end{bmatrix}$$

- Markov matrix (all element  $> 0$ , each row adds to 1  $\Rightarrow$  have a (maximum) eigenvalue 1)
- the matrix  $M' = M - I$  is singular, with thus zero determinant.
- The stationary vector  $v$  of the Markov matrix:  $v^T M = v^T$ ; or  $v^T M' = 0$
- $\text{Adj}(M')M' = \det(M')I = 0$

# Markov矩阵其余特征值的绝对值小于1的证明

---

- Markov矩阵M
- 首先，1是M的特征值
- 假设存在M的特征值 $\lambda > 1$ ，则 $Mx = \lambda x$ ，令 $x_i$ 是x中最大元素，因为M每一项都大于0，每一行的和为1，即 $\lambda x$ 中的每一项都是x的每一个元素的凸组合，所以 $\lambda x$ 中的每一个都不大于 $x_i$ ，而 $\lambda > 1$ ,  $\lambda x_i > x_i$ ，与假设矛盾。

# X Demands and Gets an Extortionate Share

$$\tilde{\mathbf{p}} = \phi[(\mathbf{S}_X - P\mathbf{1}) - \chi(\mathbf{S}_Y - P\mathbf{1})],$$

$$p_1 = 1 - \phi(\chi - 1) \frac{R - P}{P - S}$$

$$p_2 = 1 - \phi \left( 1 + \chi \frac{T - P}{P - S} \right)$$

$$p_3 = \phi \left( \chi + \frac{T - P}{P - S} \right)$$

$$p_4 = 0$$

$$0 < \phi \leq \frac{(P - S)}{(P - S) + \chi(T - P)}.$$

$$\mathbf{p} = [1 - 2\phi(\chi - 1), 1 - \phi(4\chi + 1), \phi(\chi + 4), 0]$$

$$s_X = \frac{2 + 13\chi}{2 + 3\chi}, \quad s_Y = \frac{12 + 3\chi}{2 + 3\chi}.$$

Special Case

$$\chi = 1, \phi = \frac{1}{5}$$

$$\mathbf{p} = (1, 0, 1, 0)$$

# Discussion: X Demands and Gets an Extortionate Share

$$\tilde{p} = \phi[(S_X - P1) - \chi(S_Y - P1)],$$

tends to mutual defection

$$\tilde{p} = \phi[(S_X - R1) - \chi(S_Y - R1)]$$

tends to mutual cooperation

# Discussion: A ZD player meets her opponent

X	Y	Result
ZD	A simple evolution player	No dilemma
ZD	An evolution player with a theory in mind	Become an ultimatum game
ZD	ZD	May leads to negotiate
